Pinus echinata Mill.
Family: Pinaceae
Shortleaf Pine

The genus *Pinus* is composed of about 100 species native to temperate and tropical regions of the world. Wood of pine can be separated microscopically into the white, red and yellow pine groups. The word *pinus* is the classical Latin name. The word *echinata* means spiny or prickly, referring to the cones. Shortleaf pine is one of the southern pines.

**Distribution:** Shortleaf pine is native to extreme southeastern New York and New Jersey west to Pennsylvania, southern Ohio, eastern Kentucky, southern Illinois and southern Missouri south to eastern Oklahoma and eastern Texas east to northern Florida and Georgia.

**The Tree:** Shortleaf pine trees normally reach heights of 100 feet, with diameters of 3 feet. Exceptional trees may grow to 130 feet tall, with a diameter of 4 feet.

**General Wood Characteristics:** The sapwood of shortleaf pine is a yellowish white, while the heartwood is a reddish brown. The sapwood is usually wide in second growth stands. Heartwood begins to form when the tree is about 20 years old. In old, slow-growth trees, sapwood may be only 1 to 2 inches in width. The wood of shortleaf pine is very heavy and strong, very stiff, hard and moderately high in shock resistance. It also has a straight grain, medium texture and is difficult to work with hand tools. It ranks high in nail holding capacity, but there may be difficulty in gluing. All the southern pines have moderately large shrinkage but are stable when properly seasoned. The heartwood is rated as moderate to low in resistance to decay. The sapwood is more easily impregnated with preservatives.

\textbf{Working Properties:} Shortleaf pine is difficult to work with hand tools. It ranks high in nail holding capacity, but there may be difficulty in gluing.

\textbf{Durability:} The heartwood is rated as moderate to low in resistance to decay.

\textbf{Preservation:} The sapwood is more easily impregnated with preservatives.

\textbf{Uses:} The denser and higher strength southern pine is used extensively in construction of factories, warehouses, bridges, trestles, and docks in the form of stringers, and for roof trusses, beams, posts, joists, and piles. Lumber of lower density and strength finds many uses for building material, such as interior finish, sheathing, subflooring, and joists and for boxes, pallets, and crates. Southern pine is also used also for tight and slack cooperage. When used for railroad crossties, piles, poles and mine timbers, it is usually treated with preservatives. The manufacture of structural grade plywood from southern pine has become a major wood-using industry.
Toxicity: In general, working with pine wood may cause dermatitis, allergic bronchial asthma or rhinitis in some individuals (5,9&14).
