AVERAGE WEIGHTS OF VARIOUS SPECIES OF WOOD

In making the weight determinations given in the following table, the U. S. Forest Products Laboratory used small, clear specimens secured from the top 4 feet of the 16-foot butt logs of typical trees. Wood thus selected probably averages a trifle heavier than the wood in ordinary ties, structural timbers, poles, and posts. Such large pieces usually include the pith, or are taken from top logs where relatively light weight material is frequently encountered.
